

Doubts.

1. Where will all the new tabs will come. As all the features are employee side. Will it come in user's sidebar?
2. Performance review tab:- I am guessing it's being used by HR to fill for all the employees. What can be the actions that can be formed by an employee on this tab? Will it be only be viewable?
3. Employee benefits tab :- As there are many types of benefits will all come under sub categories as, you have done for exams. Or will it be like this, that all the things will come in right part after user clicks on employee benefits tab.
4. Digital signature tab :- Will it be for all users or just for employees. And what will the the relation used for this per user. I mean, a user can have many signatures or just one final signature.
5. Examination changes:- If time permits, will do it.
6. Design Changes :- Kindly make a list of all the designed changes, it will be better if you can provide me screenshots of the fixes. And also the additions if needed.
7. Dashboard data updation :- What data and where do I need to put it in more detail.

Let me know the priority of things. Otherwise I will be comfortable with the most easiest task to be done first. So, that I can concentrate properly on the last and hardest one at the end. But as, you say. I will do it.

And for pdf editing. In backend I was able to edit the pdfs. But in there I specified the field names and inputs manually. But in browser we need to figure out. If user clicks one one of the input fields of the form, how is to going to tell to rails that this is the input field name and this is the input because. They both are on independent platform. That's the challenge.

Thank you.
